

Economics D10-1: Lecture 4

Classical Demand Theory: Preference-based approach to consumer behavior (MWG 3)

Logical structure of the preference-based approach

- Assumptions on preferences:
 - Substantive
 - Rational
 - Complete
 - Transitive
 - Tractability
 - Monotonic
 - Continuous
 - Convex
 - Convenient special cases
 - Homothetic
 - Quasi-linear
- Utility function representation and equivalencies
 - Existence of continuous, increasing function u representing preferences
 - Quasi-concavity of u
 - Linear homogeneity of u
 - Quasi-linearity of u
- Testable implications of utility maximization:
 - Law of Compensated Demand
 - Slutsky symmetry

Consumer Preferences: Rationality and Desirability

- Binary *preference relation* = on consumption set X .
- Rationality: a preference relation = is *rational* if it is
 - *Complete*: $\forall \mathbf{x}, \mathbf{y} \in X$, either $\mathbf{x} \succeq \mathbf{y}$ or $\mathbf{y} \succeq \mathbf{x}$, or both.
 - *Transitive*: $\mathbf{x} \succeq \mathbf{y}$ and $\mathbf{y} \succeq \mathbf{z} \Rightarrow \mathbf{x} \succeq \mathbf{z}$
- Desirability assumptions:
 - Monotonicity: = is *monotone* on X if, for $\mathbf{x}, \mathbf{y} \in X$, $\mathbf{y} \gg \mathbf{x}$ implies $\mathbf{y} \succ \mathbf{x}$.
 - Strong monotonicity: = is *strongly monotone* if $\mathbf{y} \succeq \mathbf{x}$ and $\mathbf{y} \neq \mathbf{x}$ imply that $\mathbf{y} \succ \mathbf{x}$.
 - Local nonsatiation: = is *locally nonsatiated* if for every $\mathbf{x} \in X$ and $\varepsilon > 0 \exists \mathbf{y} \in X$ s.t. $\|\mathbf{y} - \mathbf{x}\| = \varepsilon$ and $\mathbf{y} \succ \mathbf{x}$.

Consumer Preferences: other properties

- Convexity: Let X be a convex set. The preference relation = is *convex* if, $\forall \mathbf{x} \in X$, the upper contour set $\{\mathbf{y} \in X: \mathbf{y} \succeq \mathbf{x}\}$ is convex
- Strict convexity: Let X be a convex set. The preference relation = is *strictly convex* if, $\forall \mathbf{x}, \mathbf{y}, \mathbf{z} \in X$, $\mathbf{y} \succeq \mathbf{x}$, $\mathbf{z} \succeq \mathbf{x}$, and $\mathbf{y} \neq \mathbf{z}$ implies $t\mathbf{y} + (1-t)\mathbf{z} \succ \mathbf{x}$ for all $0 < t < 1$.
- Homotheticity: A monotone preference relation = on $X = \mathbb{R}_+^L$ is *homothetic* if $\mathbf{x} \succeq \mathbf{y} \Leftrightarrow t\mathbf{x} \succeq t\mathbf{y}$ for all $t > 0$.
- Quasilinearity: The monotone preference relation = on $X = (-\infty, \infty) \times \mathbb{R}_+^{L-1}$ is *quasilinear* with respect to commodity 1 if $\mathbf{x} \succeq \mathbf{y} \Leftrightarrow (\mathbf{x} + t\mathbf{e}_1) \succeq (\mathbf{y} + t\mathbf{e}_1)$, where $\mathbf{e}_1 = (1, 0, \dots, 0)$.

Consumer Preferences: Continuity

- Continuity (Alternative Definition):
 - The preference relation \succeq is *continuous* if, $\forall \mathbf{x} \in X = \mathfrak{R}^L_+$, the “at least as good as sets” $\succeq(\mathbf{x}) = \{\mathbf{z} \in X: \mathbf{z} \succeq \mathbf{x}\}$ and the “no better than sets” $\preceq(\mathbf{x}) = \{\mathbf{z} \in X: \mathbf{x} \succeq \mathbf{z}\}$ are closed in \mathfrak{R}^L_+ . (Equivalently, define the “better than” and “worse than” sets to open in \mathfrak{R}^L_+ .)
- Lexicographic (strict) preference ordering L .
 - For all $\mathbf{x}, \mathbf{y} \in X = \mathfrak{R}^L_+$, $\mathbf{x} L \mathbf{y}$ if $x_1 > y_1$, or if $x_1 = y_1$ and $x_2 > y_2$, or if $x_i = y_i$ for $i = 1, \dots, k-1 \leq L-1$ and $x_k > y_k$.
- L is not continuous.

Consumer Preferences: utility function representations

- Definition: The utility function $u: X \rightarrow \mathfrak{R}$ *represents* \succeq if, $\forall \mathbf{x}, \mathbf{y} \in X$, $u(\mathbf{x}) \geq u(\mathbf{y}) \Leftrightarrow \mathbf{x} \succeq \mathbf{y}$.
- Theorem: The preference ordering \succeq on \mathfrak{R}^L_+ can be represented by a *continuous* utility function $u: \mathfrak{R}^L_+ \rightarrow \mathfrak{R}$ if it is rational, monotone, and continuous.
- Proof:
 - Let $\mathbf{e} = (1, 1, \dots, 1)$. Define $u(\mathbf{x})$ so that $u(\mathbf{x})\mathbf{e} \gg \mathbf{x}$. (The completeness, monotonicity, and continuity of \succeq ensures that this number exists and is unique for every \mathbf{x} .)
 - Let $\mathbf{x} = \mathbf{y}$. Then, by construction, $u(\mathbf{x})\mathbf{e} = u(\mathbf{y})\mathbf{e}$. By monotonicity, $u(\mathbf{x}) \geq u(\mathbf{y})$. Let $u(\mathbf{x}) \geq u(\mathbf{y})$. Again by construction, $\mathbf{x} \gg u(\mathbf{x})\mathbf{e} = u(\mathbf{y})\mathbf{e} \gg \mathbf{y}$. Then, by transitivity, $\mathbf{x} \succ \mathbf{y}$.

Consumer Preferences: continuity of the utility function

- Proof (cond.):

(iii) For continuity of u , we need to show that the inverse image sets under u of every open ball in \Re_+ are open in \Re_+^L . Now,

$$\begin{aligned} u^{-1}((a,b)) &= \{\mathbf{x} \in \Re_+^L : a < u(\mathbf{x}) < b\} \\ &= \{\mathbf{x} \in \Re_+^L : a\mathbf{e} < u(\mathbf{x})\mathbf{e} < b\mathbf{e}\} \\ &= \{\mathbf{x} \in \Re_+^L : a\mathbf{e} < \mathbf{x} < b\mathbf{e}\} \\ &= >(a\mathbf{e}) \cap >(b\mathbf{e}) \end{aligned}$$

By the continuity of \succ , the above sets are open in \Re_+^L , as is there intersection.
