# Foundations for the New Keynesian Model

Lawrence J. Christiano

# Objective

- Describe a very simple model economy with no monetary frictions.
  - Describe its properties.
  - 'markets work well'
- Modify the model to include price setting frictions.
  - Now markets won't necessarily work so well, unless monetary policy is good.

### Model

• Household preferences:

$$E_0 \sum_{t=0}^{\infty} \beta^t \left\{ \log C_t - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right\},\$$

 $\tau_t = \lambda \tau_{t-1} + \varepsilon_t^{\tau}, \ \varepsilon_t^{\tau} \sim iidN(0, \sigma_{\varepsilon}^2)$ 

# Production

- Final output requires lots of intermediate inputs:  $Y_{t} = \left[\int_{0}^{1} Y_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}}, \ \varepsilon > 1$
- Production of intermediate inputs:

$$Y_{i,t} = e^{a_t} N_{i,t}, \ \Delta a_t = \rho \Delta a_{t-1} + \varepsilon_t^a, \ \varepsilon_t^a \sim iidN(0, \sigma_a^2)$$

• Constraint on allocation of labor:

$$\int_0^1 N_{it} di = N_t$$

# **Efficient Allocation of Total Labor**

- Suppose total labor,  $N_t$ , is fixed.
- What is the best way to allocate N<sub>t</sub> among the various activities, 0 ≤ i ≤ 1?
- Answer:
  - allocate labor equally across all the activities

$$N_{it} = N_t$$
, all *i*

# Suppose Labor Not Allocated Equally

• Example:

$$N_{it} = \begin{cases} 2\alpha N_t & i \in \left[0, \frac{1}{2}\right] \\ 2(1-\alpha)N_t & i \in \left[\frac{1}{2}, 1\right] \end{cases}, \ 0 \le \alpha \le 1.$$

• Note that this is a particular distribution of labor across activities:

$$\int_{0}^{1} N_{it} di = \frac{1}{2} 2\alpha N_{t} + \frac{1}{2} 2(1-\alpha)N_{t} = N_{t}$$

### Labor Not Allocated Equally, cnt'd

$$\begin{split} Y_{t} &= \left[\int_{0}^{1} Y_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= \left[\int_{0}^{\frac{1}{2}} Y_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di + \int_{\frac{1}{2}}^{1} Y_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= e^{a_{t}} \left[\int_{0}^{\frac{1}{2}} N_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di + \int_{\frac{1}{2}}^{1} N_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= e^{a_{t}} \left[\int_{0}^{\frac{1}{2}} (2\alpha N_{t})^{\frac{\varepsilon-1}{\varepsilon}} di + \int_{\frac{1}{2}}^{1} (2(1-\alpha)N_{t})^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= e^{a_{t}} N_{t} \left[\int_{0}^{\frac{1}{2}} (2\alpha)^{\frac{\varepsilon-1}{\varepsilon}} di + \int_{\frac{1}{2}}^{1} (2(1-\alpha))^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= e^{a_{t}} N_{t} \left[\int_{0}^{\frac{1}{2}} (2\alpha)^{\frac{\varepsilon-1}{\varepsilon}} + \frac{1}{2} (2(1-\alpha))^{\frac{\varepsilon-1}{\varepsilon}} \right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= e^{a_{t}} N_{t} \left[\frac{1}{2} (2\alpha)^{\frac{\varepsilon-1}{\varepsilon}} + \frac{1}{2} (2(1-\alpha))^{\frac{\varepsilon-1}{\varepsilon}} \right]^{\frac{\varepsilon}{\varepsilon-1}} \\ &= e^{a_{t}} N_{t} f(\alpha) \end{split}$$

$$f(\alpha) = \left[\frac{1}{2}(2\alpha)^{\frac{\varepsilon-1}{\varepsilon}} + \frac{1}{2}(2(1-\alpha))^{\frac{\varepsilon-1}{\varepsilon}}\right]^{\frac{\varepsilon}{\varepsilon-1}}$$

# Economy with Efficient N Allocation

• Efficiency dictates

 $N_{it} = N_t$  all i

• So, with efficient production:

$$Y_t = e^{a_t} N_t$$

• Resource constraint:

$$C_t \leq Y_t$$

• Preferences:

$$E_0 \sum_{t=0}^{\infty} \left( \log C_t - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right), \ \tau_t = \lambda \tau_{t-1} + \varepsilon_t^{\tau}, \ \varepsilon_t^{\tau} \sim iid,$$

# **Efficient Determination of Labor**

• Lagrangian:

$$\max_{C_t,N_t} E_0 \sum_{t=0}^{\infty} \beta^t \left\{ \underbrace{-\log C_t - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi}}_{u(C_t,N_t,\tau_t)} + \lambda_t [e^{a_t}N_t - C_t] \right\}$$

• First order conditions:

$$u_c(C_t, N_t, \tau_t) = \lambda_t, \ u_n(C_t, N_t, \tau_t) + \lambda_t e^{a_t} = 0$$

• or:

$$u_{n,t}+u_{c,t}e^{a_t}=0$$

=

marginal cost of labor in consumption units =  $\frac{-\frac{du}{dN_t}}{\frac{du}{dC_t}} = \frac{dC_t}{dN_t}$ 

 $-u_{n,t}$ 

marginal product of labor

 $e^{a_t}$ 

# Efficient Determination of Labor, cont'd

• Solving the fonc's:

$$\frac{-u_{n,t}}{u_{c,t}} = e^{a_t}$$

$$C_t \exp(\tau_t) N_t^{\varphi} = e^{a_t}$$

$$e^{a_t} N_t \exp(\tau_t) N_t^{\varphi} = e^{a_t}$$

$$N_t = \exp\left(\frac{-\tau_t}{1+\varphi}\right)$$

$$T_t = \exp\left(a_t - \frac{\tau_t}{1+\varphi}\right)$$

- Note:
  - Labor responds to preference shock, not to tech shock

### Response to a Jump in a

Leisure, 1-N

# Decentralizing the Model

- Give households budget constraints and place them in markets.
- Give the production functions to firms and suppose that they seek to maximize profits.

### Households

• Solve:

$$\max E_0 \sum_{t=0}^{\infty} \beta^t \left\{ \log C_t - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right\},\$$

• Subject to:

bonds purchases in *t* wage rate profits (real) interest on bonds  $C_t + \overbrace{B_{t+1}} \leq \overbrace{w_t} N_t + \overbrace{\pi_t} + \overbrace{r_{t-1}} B_t$ 

#### • First order conditions:

 $\frac{-u_{n,t}}{u_{c,t}} = C_t \exp(\tau_t) N_t^{\varphi} = w_t$  'marginal cost of working equals marginal benefit'  $u_{c,t} = \beta E_t u_{c,t+1} r_t$  'marginal cost of saving equals marginal benefit'

### **Final Good Firms**

• Final good firms buy  $Y_{i,t}$ ,  $i \in (0,1)$ , at given prices,  $P_{i,t}$ , to maximize profits:

$$Y_t - \int_0^1 P_{i,t} Y_{i,t} di$$

Subject to

$$Y_t = \left[\int_0^1 Y_{i,t}^{\frac{\varepsilon-1}{\varepsilon}} di\right]^{\frac{\varepsilon}{\varepsilon-1}}$$

• Fonc's:  

$$P_{i,t} = \left(\frac{Y_t}{Y_{i,t}}\right)^{\frac{1}{\varepsilon}}$$

$$\rightarrow Y_{i,t} = P_{i,t}^{-\varepsilon}Y_t, \ 1 = \int_0^1 P_{i,t}^{1-\varepsilon} di$$

# Intermediate Good Firms

• For each  $Y_{i,t}$  there is a single producer who is a monopolist in the product market and hires labor,  $N_{i,t}$  in competitive labor markets.

• Subsidy will be required to ensure markets work efficiently.

### Intermediate Good Firms

### ith Intermediate Good Firm

- Problem:  $\max_{N_{it}} P_{it} Y_{it} s_t Y_{it}$
- Subject to demand for  $Y_{i,t}$ :  $Y_{i,t} = P_{i,t}^{-\varepsilon} Y_t$
- Problem:

$$\max_{N_{it}} P_{it} P_{i,t}^{-\varepsilon} Y_t - s_t P_{i,t}^{-\varepsilon} Y_t$$
  
fonc :  $(1 - \varepsilon) P_{it}^{-\varepsilon} Y_t + \varepsilon s_t P_{i,t}^{-\varepsilon - 1} Y_t = 0$   
 $P_{it} = \frac{\varepsilon}{\varepsilon - 1} s_t$  'price is markup over marginal cost'

• Note: all prices are the same, so resources allocated efficiently across intermediate good firms.

$$P_{i,t} = P_{j,t} = 1$$
, because  $1 = \int_{0}^{1} P_{i,t}^{1-\varepsilon} di$ 

# Equilibrium

• Pulling things together:

$$1 = \frac{\varepsilon}{\varepsilon - 1} s_t = \frac{\varepsilon}{\varepsilon - 1} \frac{(1 - v)w_t}{\exp(a_t)}$$
  
household fonc  
$$\stackrel{\frown}{=} \frac{\varepsilon(1 - v)}{\varepsilon - 1} \frac{\frac{-u_{n,t}}{u_{c,t}}}{\exp(a_t)}$$
  
if  $\frac{\varepsilon(1 - v)}{\varepsilon - 1} = 1$   $\frac{-u_{n,t}}{\frac{u_{c,t}}{\varepsilon - 1}}$ .

If proper subsidy is provided to monopolists, employment is efficient:

if 
$$1 - v = \frac{\varepsilon - 1}{\varepsilon}$$
, then  $\frac{-u_{n,t}}{u_{c,t}} = \exp(a_t)$ 

### **Equilibrium Allocations**

#### • With efficient subsidy,

functional form  

$$\frac{-u_{n,t}}{u_{c,t}} \longrightarrow C_t \exp(\tau_t) N_t^{\varphi} \longrightarrow \exp(a_t) \exp(\tau_t) N_t^{1+\varphi} = \exp(a_t)$$

$$\rightarrow N_t = \exp\left(\frac{-\tau_t}{1+\varphi}\right)$$

$$C_t = e^{a_t} N_t = \exp\left(a_t - \frac{\tau_t}{1+\varphi}\right)$$

• Bond market clearing implies:

 $B_t = 0$  always

### Interest Rate in Equilibrium

• Interest rate backed out of household intertemporal Euler equation:

$$u_{c,t} = \beta E_t u_{c,t+1} r_t \rightarrow \frac{1}{C_t} = \beta E_t \frac{1}{C_{t+1}} r_t$$

$$\rightarrow r_{t} = \frac{1}{\beta E_{t} \frac{C_{t}}{C_{t+1}}} = \frac{1}{\beta E_{t} \exp[c_{t} - c_{t+1}]} = \frac{1}{\beta E_{t} \exp[a_{t} - a_{t+1} - \frac{\tau_{t} - \tau_{t+1}}{1 + \varphi}]}$$

$$= \frac{1}{\beta \exp\left[E_t\left(-\Delta a_{t+1} - \frac{\tau_t - \tau_{t+1}}{1 + \varphi}\right) + \frac{1}{2}V\right]}, V = \sigma_a^2 + \left(\frac{1}{1 + \varphi}\right)^2 \sigma_\lambda^2$$

$$\log r_t = -\log\beta + E_t \left( \underbrace{\Delta a_{t+1} - \frac{\tau_{t+1} - \tau_t}{1 + \varphi}}_{c_{t+1} - \frac{\tau_t}{1 + \varphi}} \right) + \frac{1}{2}V$$

using assumptions about  $\Delta a_t$  and  $\tau_t$ 

$$= -\log\beta + \rho\Delta a_t - \frac{(\lambda - 1)\tau_t}{1 + \varphi} + \frac{1}{2}V$$

### **Dynamic Properties of the Model**

### Key Features of Equilibrium Allocations

- Allocations *efficient* (as long as monopoly power neutralized)
- Employment does not respond to technology
  - Improvement in technology raises marginal product of labor and marginal cost of labor by same amount.
- First best consumption not a function of intertemporal considerations
  - Discount rate irrelevant.
  - Anticipated future values of shocks irrelevant.
- Natural rate of interest steers consumption and employment towards their natural levels.

# Introducing Price Setting Frictions (Clarida-Gali-Gertler Model)

Households maximize:

$$E_0 \sum_{t=0}^{\infty} \left( \log C_t - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right), \ \tau_t = \lambda \tau_{t-1} + \varepsilon_t^{\tau}, \ \varepsilon_t^{\tau} \sim iid,$$

• Subject to:

Profits, net of taxes raised by Government to finance subsidies.

$$P_tC_t + B_{t+1} \leq W_tN_t + R_{t-1}B_t + T_t$$

• Intratemporal first order condition:

$$C_t \exp(\tau_t) N_t^{\varphi} = \frac{W_t}{P_t}$$

# Household Intertemporal FONC

• Condition:

$$1 = \beta E_t \frac{u_{c,t+1}}{u_{c,t}} \frac{R_t}{1 + \pi_{t+1}}$$

- or

$$1 = \beta E_t \frac{C_t}{C_{t+1}} \frac{R_t}{1 + \pi_{t+1}}$$
  
=  $\beta E_t \exp[\log(R_t) - \log(1 + \pi_{t+1}) - \Delta c_{t+1}]$   
 $\simeq \beta \exp[\log(R_t) - E_t \pi_{t+1} - E_t \Delta c_{t+1}], c_t \equiv \log(C_t)$ 

#### - take log of both sides:

$$0 = \log(\beta) + r_t - E_t \pi_{t+1} - E_t \Delta c_{t+1}, r_t = \log(R_t)$$
  
- or  
$$c_t = -\log(\beta) - [r_t - E_t \pi_{t+1}] + c_{t+1}$$

### Final Good Firms

- Buy  $Y_{i,t}$ ,  $i \in [0,1]$  at prices  $P_{i,t}$  and sell  $Y_t$  for  $P_t$
- Take all prices as given (competitive)
- Profits:

$$P_t Y_t - \int_0^1 P_{i,t} Y_{i,t} di$$

• Production function:

$$Y_t = \left[\int_0^1 Y_{i,t}^{\frac{\varepsilon-1}{\varepsilon}}\right]^{\frac{\varepsilon}{\varepsilon-1}} di, \ \varepsilon > 1,$$

• First order condition:

$$Y_{i,t} = Y_t \left(\frac{P_{i,t}}{P_t}\right)^{-\varepsilon} \longrightarrow P_t = \left(\int_0^1 P_{i,t}^{(1-\varepsilon)} di\right)^{\frac{1}{1-\varepsilon}}$$

# Intermediate Good Firms

- Each ith good produced by a single monopoly producer.
- Demand curve:

$$Y_{i,t} = Y_t \left(\frac{P_{i,t}}{P_t}\right)^{-\varepsilon}$$

• Technology:

$$Y_{i,t} = \exp(a_t)N_{i,t}, \ \Delta a_t = \rho \Delta a_{t-1} + \varepsilon_t^a,$$

• Calvo Price-setting Friction

$$P_{i,t} = \begin{cases} \tilde{P}_t & \text{with probability } 1 - \theta \\ P_{i,t} & \text{with probability } \theta \end{cases},$$

### Marginal Cost

real marginal cost =

$$s_t = \frac{\frac{dCost}{dwor \ker}}{\frac{dOutput}{dwor \ker}} = \frac{(1-v)W_t/P_t}{\exp(a_t)}$$

$$= \frac{\frac{\varepsilon-1}{\varepsilon} \text{ in efficient setting}}{(1-v)} C_t \exp(\tau_t) N_t^{\varphi} \exp(a_t)$$

# The Intermediate Firm's Decisions

- *ith* firm is required to satisfy whatever demand shows up at its posted price.
- Its only real decision is to adjust price whenever the opportunity arises.

# Intermediate Good Firm

Present discounted value of firm profits:

• Each of the  $1 - \theta$  firms that can optimize price choose  $\tilde{P}_t$  to optimize

> in selecting price, firm only cares about future states in which it can't reoptimize

$$v_{t+j}[\tilde{P}_t Y_{i,t+j} - P_{t+j} S_{t+j} Y_{i,t+j}].$$

period t+j profits sent to household

total cost

# Intermediate Good Firm Problem

• Substitute out the demand curve:

$$E_{t} \sum_{j=0}^{\infty} (\beta\theta)^{j} v_{t+j} [\tilde{P}_{t} Y_{i,t+j} - P_{t+j} S_{t+j} Y_{i,t+j}]$$
  
=  $E_{t} \sum_{j=0}^{\infty} (\beta\theta)^{j} v_{t+j} Y_{t+j} P_{t+j}^{\varepsilon} [\tilde{P}_{t}^{1-\varepsilon} - P_{t+j} S_{t+j} \tilde{P}_{t}^{-\varepsilon}]$ 

• Differentiate with respect to  $\tilde{P}_t$ :

$$E_t \sum_{j=0}^{\infty} (\beta \theta)^j v_{t+j} Y_{t+j} P_{t+j}^{\varepsilon} [(1-\varepsilon)(\tilde{P}_t)^{-\varepsilon} + \varepsilon P_{t+j} S_{t+j} \tilde{P}_t^{-\varepsilon-1}] = 0,$$

• or

$$E_t \sum_{j=0}^{\infty} (\beta \theta)^j v_{t+j} Y_{t+j} P_{t+j}^{\varepsilon+1} \left[ \frac{\tilde{P}_t}{P_{t+j}} - \frac{\varepsilon}{\varepsilon - 1} s_{t+j} \right] = 0.$$

### Intermediate Good Firm Problem

• Objective:

$$E_{t} \sum_{j=0}^{\infty} (\beta\theta)^{j} \frac{u'(C_{t+j})}{P_{t+j}} Y_{t+j} P_{t+j}^{\varepsilon+1} \left[ \frac{\tilde{P}_{t}}{P_{t+j}} - \frac{\varepsilon}{\varepsilon - 1} s_{t+j} \right] = 0.$$
  

$$\rightarrow E_{t} \sum_{j=0}^{\infty} (\beta\theta)^{j} P_{t+j}^{\varepsilon} \left[ \frac{\tilde{P}_{t}}{P_{t+j}} - \frac{\varepsilon}{\varepsilon - 1} s_{t+j} \right] = 0.$$

$$E_t \sum_{j=0}^{\infty} (\beta \theta)^j (X_{t,j})^{-\varepsilon} \Big[ \tilde{p}_t X_{t,j} - \frac{\varepsilon}{\varepsilon - 1} s_{t+j} \Big] = 0,$$

$$\tilde{p}_{t} = \frac{\tilde{P}_{t}}{P_{t}}, X_{t,j} = \begin{cases} \frac{1}{\bar{\pi}_{t+j}\bar{\pi}_{t+j-1}\cdots\bar{\pi}_{t+1}}, j \ge 1\\ 1, j = 0. \end{cases}, X_{t,j} = X_{t+1,j-1}\frac{1}{\bar{\pi}_{t+1}}, j > 0 \end{cases}$$

### Intermediate Good Firm Problem

• Want  $\tilde{p}_t$  in:

$$E_t \sum_{j=0}^{\infty} (\beta \theta)^j (X_{t,j})^{-\varepsilon} \left[ \tilde{p}_t X_{t,j} - \frac{\varepsilon}{\varepsilon - 1} s_{t+j} \right] = 0$$

• Solution:

$$\tilde{p}_{t} = \frac{E_{t} \sum_{j=0}^{\infty} (\beta \theta)^{j} (X_{t,j})^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} S_{t+j}}{E_{t} \sum_{j=0}^{\infty} (\beta \theta)^{j} (X_{t,j})^{1-\varepsilon}} = \frac{K_{t}}{F_{t}}$$

• But, still need expressions for  $K_t$ ,  $F_t$ .

$$K_{t} = E_{t} \sum_{j=0}^{\infty} (\beta\theta)^{j} (X_{t,j})^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} s_{t+j}$$

$$= \frac{\varepsilon}{\varepsilon - 1} s_{t} + \beta\theta E_{t} \sum_{j=1}^{\infty} (\beta\theta)^{j-1} \left(\frac{1}{\overline{\pi}_{t+1}} X_{t+1,j-1}\right)^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} s_{t+j}$$

$$= \frac{\varepsilon}{\varepsilon - 1} s_{t} + \beta\theta E_{t} \left(\frac{1}{\overline{\pi}_{t+1}}\right)^{-\varepsilon} \sum_{j=0}^{\infty} (\beta\theta)^{j} X_{t+1,j}^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} s_{t+1+j}$$

$$= \frac{\varepsilon}{\varepsilon - 1} s_{t} + \beta\theta \sum_{t=1}^{\varepsilon} E_{t} \sum_{t+1}^{\varepsilon} \left(\frac{1}{\overline{\pi}_{t+1}}\right)^{-\varepsilon} \sum_{j=0}^{\infty} (\beta\theta)^{j} X_{t+1,j}^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} s_{t+1+j}$$

$$= \frac{\varepsilon}{\varepsilon - 1} s_{t} + \beta\theta E_{t} \left(\frac{1}{\overline{\pi}_{t+1}}\right)^{-\varepsilon} \sum_{j=0}^{\varepsilon} (\beta\theta)^{j} X_{t+1,j}^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} s_{t+1+j}$$

$$= \frac{\varepsilon}{\varepsilon - 1} s_{t} + \beta\theta E_{t} \left(\frac{1}{\overline{\pi}_{t+1}}\right)^{-\varepsilon} K_{t+1}$$

• From previous slide:

$$K_t = \frac{\varepsilon}{\varepsilon - 1} s_t + \beta \theta E_t \left(\frac{1}{\overline{\pi}_{t+1}}\right)^{-\varepsilon} K_{t+1}.$$

• Substituting out for marginal cost:

$$\frac{\varepsilon}{\varepsilon - 1} s_t = \frac{\varepsilon}{\varepsilon - 1} (1 - v) \frac{\widetilde{W_t/P_t}}{\frac{dOutput/dlabor}{dOutput/dlabor}}$$

$$=\frac{\frac{\mathcal{E}}{\varepsilon-1}(1-v)}{\frac{\exp(\tau_t)N_t^{\varphi}C_t}{\exp(a_t)}}.$$

### In Sum

#### • solution:

$$\tilde{p}_{t} = \frac{E_{t} \sum_{j=0}^{\infty} (\beta \theta)^{j} (X_{t,j})^{-\varepsilon} \frac{\varepsilon}{\varepsilon - 1} S_{t+j}}{E_{t} \sum_{j=0}^{\infty} (\beta \theta)^{j} (X_{t,j})^{1-\varepsilon}} = \frac{K_{t}}{F_{t}},$$

• Where:

$$K_t = (1 - v_t) \frac{\varepsilon}{\varepsilon - 1} \frac{\exp(\tau_t) N_t^{\varphi} C_t}{\exp(a_t)} + \beta \theta E_t \left(\frac{1}{\overline{\pi}_{t+1}}\right)^{-\varepsilon} K_{t+1}.$$

$$F_t = E_t \sum_{j=0}^{\infty} (\beta \theta)^j (X_{t,j})^{1-\varepsilon} = 1 + \beta \theta E_t \left(\frac{1}{\bar{\pi}_{t+1}}\right)^{1-\varepsilon} F_{t+1}$$
# To Characterize Equilibrium

- Have equations characterizing optimization by firms and households.
- Still need:
  - Expression for all the prices. Prices,  $P_{i,t}$ ,  $0 \le i \le 1$ , will all be different because of the price setting frictions.
  - Relationship between aggregate employment and aggregate output not simple because of price distortions:

 $Y_t \neq e^{a_t} N_t$ , in general

• This part of the analysis is the reason why it made Calvo famous – it's not easy.

### Going for Prices

• Aggregate price relationship

$$P_{t} = \left[\int_{0}^{1} P_{i,t}^{(1-\varepsilon)} di\right]^{\frac{1}{1-\varepsilon}}$$

$$= \left[ \int_{\text{firms that reoptimize price}} P_{i,t}^{(1-\varepsilon)} di + \int_{\text{firms that don't reoptimize price}} P_{i,t}^{(1-\varepsilon)} di \right]^{\frac{1}{1-\varepsilon}}$$

all reoptimizers choose same price 
$$= \left[ (1-\theta)\tilde{P}_t^{(1-\varepsilon)} + \int_{\text{firms that don't reoptimize price}} P_{i,t}^{(1-\varepsilon)} di \right]^{\frac{1}{1-\varepsilon}}$$

In principle, to solve the model need all the prices, P<sub>t</sub>, P<sub>i,t</sub>, 0 ≤ i ≤ 1

- Fortunately, that won't be necessary.

#### Key insight

$$\int_{\text{firms that don't reoptimize price in } t} P_{i,t}^{(1-\varepsilon)} di$$

add over prices, weighted by # of firms posting that price

 $\sim$ 

'number' of firms that had price, 
$$P(\omega)$$
, in  $t-1$  and were not able to reoptimize in  $t$   
 $f_{t-1,t}(\omega)$ 
 $P(\omega)^{(1-\varepsilon)}$ 

#### Applying the Insight

By Calvo randomization assumption

total 'number' of firms with price 
$$P(\omega)$$
 in  $t-1$ 

• Substituting:

firms that don't reoptimize price 
$$P_{i,t}^{(1-\varepsilon)} di = \int f_{t-1,t}(\omega) P(\omega)^{(1-\varepsilon)} d\omega$$

$$=\theta \int f_{t-1}(\omega) P(\omega)^{(1-\varepsilon)} d\omega$$

$$= \theta P_{t-1}^{(1-\varepsilon)}$$

# Expression for $\tilde{p}_t$ in terms of aggregate inflation

Conclude that this relationship holds between prices:

$$P_t = \left[ (1-\theta) \tilde{P}_t^{(1-\varepsilon)} + \theta P_{t-1}^{(1-\varepsilon)} \right]^{\frac{1}{1-\varepsilon}}.$$

– Only two variables here!

• Divide by  $P_t$ :

$$1 = \left[ (1-\theta) \tilde{p}_t^{(1-\varepsilon)} + \theta \left(\frac{1}{\bar{\pi}_t}\right)^{(1-\varepsilon)} \right]^{\frac{1}{1-\varepsilon}}$$

• Rearrange:

$$\tilde{p}_t = \left[\frac{1-\theta\bar{\pi}_t^{(\varepsilon-1)}}{1-\theta}\right]^{\frac{1}{1-\varepsilon}}$$

# Relation Between Aggregate Output and Aggregate Inputs

- Technically, there is no 'aggregate production function' in this model
  - If you know how many people are working, N, and the state of technology, a, you don't have enough information to know what Y is.
  - Price frictions imply that resources will not be efficiently allocated among different inputs.
    - Implies *Y* low for given *a* and *N*. How low?
    - Tak Yun (JME) gave a simple answer.

#### Tak Yun Algebra

$$Y_t^* = \int_0^1 Y_{i,t} di \left( = \int_0^1 A_t N_{i,t} di \xrightarrow{\text{labor market clearing}} A_t N_t \right)$$

$$\stackrel{\text{demand curve}}{\frown} Y_t \int_0^1 \left(\frac{P_{i,t}}{P_t}\right)^{-\varepsilon} di$$

$$= Y_t P_t^{\varepsilon} \int_0^1 (P_{i,t})^{-\varepsilon} di$$

Calvo insight

• Where:  $P_t^{\varepsilon} \left[ \int_0^1 P_{i,t}^{-\varepsilon} di \right]^{\frac{-1}{\varepsilon}} = \left[ (1-\theta) \tilde{P}_t^{-\varepsilon} + \theta (P_{t-1}^*)^{-\varepsilon} \right]^{\frac{-1}{\varepsilon}}$ 

# Relationship Between Agg Inputs and Agg Output

• Rewriting previous equation:

$$Y_t = \left(\frac{P_t^*}{P_t}\right)^{\varepsilon} Y_t^*$$

$$= p_t^* e^{a_t} N_t,$$

• 'efficiency distortion':

$$p_t^*: \begin{cases} \leq 1 \\ = 1 \quad P_{i,t} = P_{j,t}, \text{ all } i,j \end{cases}$$

0.94

0.93

#### **Collecting Equilibrium Conditions**

• Price setting:

$$K_{t} = (1 - \nu) \frac{\varepsilon}{\varepsilon - 1} \frac{\exp(\tau_{t}) N_{t}^{\varphi} C_{t}}{A_{t}} + \beta \theta E_{t} \bar{\pi}_{t+1}^{\varepsilon} K_{t+1} (1)$$

 $F_t = 1 + \beta \theta E_t \bar{\pi}_{t+1}^{\varepsilon - 1} F_{t+1}$ (2)

• Intermediate good firm optimality and restriction across prices:

$$= \tilde{p}_{t} \text{ by firm optimality} = \tilde{p}_{t} \text{ by restriction across prices}$$

$$\underbrace{\frac{\tilde{K}_{t}}{\tilde{F}_{t}}}_{= \left[\frac{1 - \theta \bar{\pi}_{t}^{(\varepsilon - 1)}}{1 - \theta}\right]^{\frac{1}{1 - \varepsilon}}}_{= \left[\frac{1 - \theta \bar{\pi}_{t}^{(\varepsilon - 1)}}{1 - \theta}\right]^{\frac{1}{1 - \varepsilon}} (3)$$

#### **Equilibrium Conditions**

• Law of motion of (Tak Yun) distortion:

$$p_t^* = \left[ (1-\theta) \left( \frac{1-\theta \bar{\pi}_t^{(\varepsilon-1)}}{1-\theta} \right)^{\frac{\varepsilon}{\varepsilon-1}} + \frac{\theta \bar{\pi}_t^{\varepsilon}}{p_{t-1}^*} \right]^{-1} (4)$$

• Household Intertemporal Condition:

$$\frac{1}{C_t} = \beta E_t \frac{1}{C_{t+1}} \frac{R_t}{\bar{\pi}_{t+1}}$$
(5)

• Aggregate inputs and output:

$$C_t = p_t^* e^{a_t} N_t$$
 (6)

• 6 equations, 8 unknowns:

$$v, C_t, p_t^*, N_t, \bar{\pi}_t, K_t, F_t, R_t$$

• System under determined!

### Underdetermined System

- Not surprising: we added a variable, the nominal rate of interest.
- Also, we're counting subsidy as among the unknowns.
- Have two extra policy variables.
- One way to pin them down: compute optimal policy.

# Ramsey-Optimal Policy

- 6 equations in 8 unknowns.....
  - Many configurations of the 8 unknowns that satisfy the 6 equations.
  - Look for the best configurations (Ramsey optimal)
    - Value of tax subsidy and of *R* represent optimal policy
- Finding the Ramsey optimal setting of the 6 variables involves solving a simple Lagrangian optimization problem.

#### **Ramsey Problem**

$$\max_{v,p_t^*,C_t,N_t,R_t,\bar{\pi}_t,F_t,K_t} E_0 \sum_{t=0}^{\infty} \beta^t \left\{ \left( \log C_t - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right) \right\}$$

$$+ \lambda_{1t} \left[ \frac{1}{C_t} - E_t \frac{\beta}{C_{t+1}} \frac{R_t}{\bar{\pi}_{t+1}} \right]$$

$$+ \lambda_{2t} \left[ \frac{1}{p_t^*} - \left( (1-\theta) \left( \frac{1-\theta(\bar{\pi}_t)^{\varepsilon-1}}{1-\theta} \right)^{\frac{\varepsilon}{\varepsilon-1}} + \frac{\theta \bar{\pi}_t^{\varepsilon}}{p_{t-1}^*} \right) \right]$$

$$+ \lambda_{3t} [1 + E_t \bar{\pi}_{t+1}^{\varepsilon-1} \beta \theta F_{t+1} - F_t]$$

$$+ \lambda_{4t} \left[ (1 - v) \frac{\varepsilon}{\varepsilon - 1} \frac{C_t \exp(\tau_t) N_t^{\varphi}}{e^{a_t}} + E_t \beta \theta \bar{\pi}_{t+1}^{\varepsilon} K_{t+1} - K_t \right]$$

$$+ \lambda_{5t} \left[ F_t \left( \frac{1 - \theta \bar{\pi}_t^{\varepsilon - 1}}{1 - \theta} \right)^{\frac{1}{1 - \varepsilon}} - K_t \right]$$

$$+ \lambda_{6t} [C_t - p_t^* e^{a_t} N_t] \}$$

# Solving the Ramsey Problem (surprisingly easy in this case)

• First, substitute out consumption everywhere

$$\begin{split} \max_{v,p_t^*,N_t,R_t,\bar{\pi}_t,F_t,K_t} E_0 \sum_{t=0}^{\infty} \beta^t \left\{ \left( \log N_t + \log p_t^* - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right) \right. \\ \text{defines } R \longrightarrow &+ \lambda_{1t} \left[ \frac{1}{p_t^* N_t} - E_t \frac{e^{a_t} \beta}{p_{t+1}^* e^{a_{t+1}} N_{t+1}} \frac{R_t}{\bar{\pi}_{t+1}} \right] \\ &+ \lambda_{2t} \left[ \frac{1}{p_t^*} - \left( (1-\theta) \left( \frac{1-\theta(\bar{\pi}_t)^{\varepsilon-1}}{1-\theta} \right)^{\frac{\varepsilon}{\varepsilon-1}} + \frac{\theta \bar{\pi}_t^\varepsilon}{p_{t-1}^*} \right) \right] \\ \text{defines } F \longrightarrow &+ \lambda_{3t} [1 + E_t \bar{\pi}_{t+1}^{\varepsilon-1} \beta \theta F_{t+1} - F_t] \\ \text{defines } \tan &+ \lambda_{4t} \left[ (1-v) \frac{\varepsilon}{\varepsilon-1} \exp(\tau_t) N_t^{1+\varphi} p_t^* + E_t \beta \theta \bar{\pi}_{t+1}^\varepsilon K_{t+1} - K_t \right] \\ \text{defines } K &+ \lambda_{5t} \left[ F_t \left( \frac{1-\theta \bar{\pi}_t^{\varepsilon-1}}{1-\theta} \right)^{\frac{1}{1-\varepsilon}} - K_t \right] \end{split}$$

# Solving the Ramsey Problem, cnt'd

• Simplified problem:

$$\max_{\bar{\pi}_t, p_t^*, N_t} E_0 \sum_{t=0}^{\infty} \beta^t \left\{ \left( \log N_t + \log p_t^* - \exp(\tau_t) \frac{N_t^{1+\varphi}}{1+\varphi} \right) \right\}$$

$$+ \lambda_{2t} \left[ \frac{1}{p_t^*} - \left( (1-\theta) \left( \frac{1-\theta(\bar{\pi}_t)^{\varepsilon-1}}{1-\theta} \right)^{\frac{\varepsilon}{\varepsilon-1}} + \frac{\theta \bar{\pi}_t^{\varepsilon}}{p_{t-1}^*} \right) \right] \right\}$$

• First order conditions with respect to  $p_t^*$ ,  $\bar{\pi}_t$ ,  $N_t$ 

$$p_t^* + \beta \lambda_{2,t+1} \theta \bar{\pi}_{t+1}^{\varepsilon} = \lambda_{2t}, \ \bar{\pi}_t = \left[ \frac{(p_{t-1}^*)^{\varepsilon-1}}{1 - \theta + \theta(p_{t-1}^*)^{\varepsilon-1}} \right]^{\frac{1}{\varepsilon-1}}, \ N_t = \exp\left(-\frac{\tau_t}{\varphi + 1}\right)$$

• Substituting the solution for inflation into law of motion for price distortion:

$$p_t^* = \left[ (1-\theta) + \theta(p_{t-1}^*)^{(\varepsilon-1)} \right]^{\frac{1}{(\varepsilon-1)}}$$

#### Solution to Ramsey Problem

Eventually, price distortions eliminated, regardless of shocks

$$p_t^* = \left[ (1 - \theta) + \theta(p_{t-1}^*)^{(\varepsilon-1)} \right]^{\frac{1}{(\varepsilon-1)}}$$
When price distortions  
gone, so is inflation.  

$$\bar{\pi}_t = \frac{p_{t-1}^*}{p_t^*}$$

$$N_t = \exp\left(-\frac{\tau_t}{1 + \varphi}\right)$$
Efficient ('first best')  
allocations in real  
economy  

$$1 - v = \frac{\varepsilon - 1}{\varepsilon}$$

$$\longrightarrow C_t = p_t^* e^{a_t} N_t.$$

Consumption corresponds to efficient allocations in real economy, eventually when price distortions gone

# Eventually, Optimal (Ramsey) Equilibrium and Efficient Allocations in Real Economy Coincide

- The Ramsey allocations are eventually the best allocations in the economy without price frictions (i.e., 'first best allocations')
- Refer to the Ramsey allocations as the 'natural allocations'....

- Natural consumption, natural rate of interest, etc.
